

Task/Job Scheduling Algorithm

- A Task Scheduling Problem is the problem of optimally scheduling unit time tasks on a single processor, where each task has a deadline.
- For the solution of this we can apply greedy strategy.
- In a task scheduling problem a "unit-time task" is a job, run on a computer.

Example

Let $n = 9$, $(T_1, T_2, T_3, \dots, T_9)$

Deadlines $(7, 2, 5, 3, 4, 5, 2, 7, 3)$

Profit $(15, 20, 30, 18, 18, 10, 23, 16, 25)$

Find the optimal solⁿ

Tasks	Deadlines	Profit
T_1	7	15
T_2	2	20
T_3	5	30
T_4	3	18
T_5	4	18
T_6	5	10
T_7	2	23
T_8	7	16
T_9	3	25

→ Now arrange the table in decreasing order of their profit.

Tasks	Deadline	Profit
T ₃	5	30
T ₉	3	25
T ₇	2	23
T ₂	2	20
T ₄	3	18
T ₅	4	18
T ₈	7	16
T ₁	7	15
T ₆	5	10

Now we will allocate the time as per their deadlines to the task.

→ First we will select task T_3
The deadline is 5.

→ Next we select task T_9 with deadline 3.

→ Next task T_7 is selected with deadline 2.

→ Now task T_2 is selected.

Task T_2 is having deadline 2 and 1-2 slot is already allocated to T_7 .

Thus, T_2 will be allocated from 0-1.

→ Now task T_4 is having deadline 3.
But as shown in fig all the time slots from 0-3 are occupied.

Thus, we will eliminate task T_4 .

→ Now task T_5 is selected with deadline 4.

→ Now task T_8 is selected with deadline 7.

→ Now task T_1 is selected with deadline 7. But (6-7) time slot is already occupied.
Thus, T_1 will be give slot (5-6).

- Now all the time slots are occupied thus Task no. 6 i.e. T_6 will be eliminated

Selected Tasks

Task	Deadline	Profit
T_3	5	30
T_9	3	25
T_7	2	23
T_2	2	20
T_5	4	18
T_8	7	16
T_1	7	15

147

Thus, total profit incurred is 147

Activity Selection Problem

Points to remember (Steps)

- For this algorithm we have a list of activities with their starting time and finishing time.
- The goal is to select maximum number of non-conflicting activities that can be performed by a person or a machine, assuming that the person or machine involved can work on a single activity at a time.
- Any two activities are said to be non-conflicting if starting time of one activity is greater than or equal to the finishing time of the other activity.
- In order to solve this problem we first sort the activities as per their finishing time in ascending order.
- Then non-conflicting activities are selected.

Now consider the following e.g. with start and finish time of 8 activities.

Activity	Start	Finish
a_1	1	3
a_2	0	4
a_3	1	2
a_4	4	6
a_5	2	9
a_6	5	8
a_7	3	5
a_8	4	5

- Now we will find the non-conflicting activities

- ① Sort the activities as per finishing time in ascending order
- ② Select the first activity
- ③ Select new activity if its starting time is greater than or equal to the previously selected activity
- ④ Repeat step 3 till all activities are checked

→ Sorted Activity	Start	Finish
a_3	1	2
a_1	1	3
a_2	0	4
a_7	3	5
a_8	4	5
a_4	4	6
a_6	5	8
a_5	2	9

→ Select first activity

Selected Activity	-	a_3
Start	-	1
Finish	-	2

→ Select next activity whose start time is greater than or equal to the finish time of the previously selected activity.

Sorted Activity Start Finish

i →	a ₃	1	2
j →	a ₁	1	3
	a ₂	0	4
	a ₇	3	5
	a ₈	4	5
	a ₄	4	6
	a ₆	5	8
	a ₅	2	9

previously selected activity = i
next activity = j

finish time of i = 2

Start time of j = 1

is start time of j \geq finish time of i
1 \geq 2

No

So, we move to next activity

→	Sorted Activity	Start	Finish
i →	a ₃	1	2
j →	a ₂	0	4

finish time of i = 2

Start time of j = 0

∴ Start time of j \geq finish time of i
i.e. 0 \geq 2

No

So we move to next activity

Sorted Activity	Start	Finish
$i \rightarrow a_3$	1	2
$j \rightarrow a_7$	3	5

Start time of $j = 3$

finish time of $i = 2$

\therefore Start time of $j \geq$ finish time of i
i.e. $3 \geq 2$

\therefore We select the activity j

\rightarrow Now i will be incremented to newly selected activity. and j will move to the next activity

Sorted Activity	Start	Finish
$i \rightarrow a_7$	3	5
$j \rightarrow a_8$	4	5

Now, start time of $j = 4$
finish time of $i = 5$

\therefore Start time of $j \not\geq$ finish time of i

\therefore We move to next activity

Sorted Activity	Start	Finish
-----------------	-------	--------

$i \rightarrow a_7$	3	5
$j \rightarrow a_4$	4	6

Now start time of $j = 4$
finish time of $i = 5$

\therefore Start time of $j \not\geq$ finish time of i

So, we move to next activity

Sorted Activity	Start	Finish
$i \rightarrow a_7$	3	5
$j \rightarrow a_6$	5	8

Start time of $j = 4$

finish time of $i = 5$

\therefore Start time of $j \geq$ finish time of i

\therefore we select the activity j

\rightarrow Now i will be incremented to newly selected activity and j will move to the next activity

Sorted Activity	Start	Finish
$i \rightarrow a_6$	5	8
$j \rightarrow a_5$	2	9

Start time of $j = 2$

finish time of $i = 8$

\therefore Start time of $j <$ finish time of i

\therefore Thus, this activity won't be selected

Thus, the selected activities are as follow

Select Activities	Start	Finish
a_3	1	2
a_7	3	5
a_6	5	8
